Balance putty, also known as balance soil, or motor rotor putty, is a high-density, easy to knead, and hard filling putty. It is mainly used for dynamic balance calibration of motor rotors, by adjusting the weight distribution on the rotor to achieve a balanced state, reduce vibration and noise, and improve the operating efficiency and stability of the motor. Balance adhesive generally appears in the form of two components, A and B adhesive. The main components are epoxy resin, curing agent, filler, and other additives. It has good formability, strong thixotropy, and good insulation performance. It has excellent adhesion to the surface of the coil and can self harden at room temperature after sticking to the end, outer side, or other parts of the coil, achieving the purpose of dynamic balance correction. Before using balance adhesive for balance correction, A and B adhesives need to be evenly mixed in a volume ratio of 1:1, and the mixed adhesive should be used within 1 hour. Select an appropriate amount of adhesive according to the unbalanced phase and degree displayed by the rotor test of the balance machine, and stick it to the desired position.
