Abstracts

Balancing machines and systems dynamically measure and/or correct machine or component balance (load balancing). Dynamic balancing distributes the weight (mass) of a rotating body evenly around the axis of rotation, reducing vibration, improving performance and accuracy, and reducing wear. Driveshaft balancing is an important part of noise, vibration, and harshness (NVH) analysis in vehicles. A portable balancing machine can save time and money by allowing engine balancing in the field. An automatic balancing system can record vibration data, calculate a balance solution, and determine the specific rebalancing steps, after only one engine run.

According to our (Global Info Research) latest study, the global Balancing Machine and System market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
