## Abstracts

A ball bearing spline is one of the linear motion bearings and is a mechanical element used mainly where smooth linear motion is desired.

A ball bearing spline has a spline, which is a groove continuously dug in the longitudinal direction of the shaft that serves as the axis of linear motion. By sandwiching it on top of the shaft by an outer cylindrical part called a spline nut, smooth axial motion and rotational motion can be achieved on a single axis.

A ball bearing spline has several similar machine elements, but among them, it is the most suitable machine element when a smooth linear movement and rotational movement around an axis are also to be conveyed, while taking a relatively large load.

According to our (Global Info Research) latest study, the global Ball Bearing Spline market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
