The global Ball Cage Universal Joint market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A ball cage universal joint is a mechanical device used to connect two shafts, allowing them to rotate at different angles and directions to affect the transmission of power. It consists of two ball cages and a cross shaft. The ball cage is connected to both ends of the shaft, and the cross shaft connects the two ball cages. This design enables the universal joint to rotate freely in multiple directions and is suitable for applications where power needs to be transmitted but the axis angle is not fixed, such as automotive transmission systems, engineering machinery and ship transmission systems. The ball cage universal joint has the advantages of simple structure, long service life and high transmission efficiency.
