Ball mill grinding balls are the main medium for material grinding in ball mills. They crush and refine materials through impact, extrusion and friction. In the ball mill, the grinding balls are given kinetic energy and move at high speed in a sealed container (i.e., the ball mill cylinder). These moving grinding balls collide with the materials, causing the materials to break and split into smaller particles after being impacted. At the same time, the friction between the grinding balls and between the grinding balls and the cylinder wall also helps to refine the materials. The material of the grinding balls is usually selected according to the characteristics of the materials to be ground and the process requirements. Common grinding ball materials include steel balls, ceramic balls, agate balls, etc. Grinding balls of different materials have different hardness and wear resistance, and are suitable for different grinding scenarios. For example, ceramic balls are suitable for grinding materials that are sensitive to metal contamination.
