Abstracts

VCF is characterized by the collapse of one or more vertebral bodies, resulting in persistent and unbearable pain in patients. Osteoporosis, a degenerative bone disease, is a leading cause of VCF among elderly women. Metastatic bone disease, multiple myeloma, metastatic spinal tumors, and traumatic injuries also cause VCF. Individuals with VCF can undergo vertebroplasty and kyphoplasty to rectify the condition. Both procedures are minimally invasive and conducted on an outpatient basis. They include the insertion of special bone needles through the tissues in the posterior wall on the back and the injection of orthopaedic cement into the vertebral body. The usage of balloon devices makes kyphoplasty stand apart from vertebroplasty. The gradual inflation of balloon and insertion of devices help restore the pre-fracture shape and height of the vertebral bodies. The kyphoplasty procedures lead to the long-term maintenance of spinal bones injured by compression fractures. This procedure reduces pain in individuals; lessens the need for pain medications; decreases dependence on canes or other supporting devices; and helps return to a relatively normal level of physical activity.
