Abstracts

According to our (Global Info Research) latest study, the global Balloon Kyphoplasty market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

VCF is characterized by the collapse of one or more vertebral bodies, resulting in persistent and unbearable pain in patients. Osteoporosis, a degenerative bone disease, is a leading cause of VCF among elderly women. Metastatic bone disease, multiple myeloma, metastatic spinal tumors, and traumatic injuries also cause VCF. Individuals with VCF can undergo vertebroplasty and kyphoplasty to rectify the condition. Both procedures are minimally invasive and conducted on an outpatient basis. They include the insertion of special bone needles through the tissues in the posterior wall on the back and the injection of orthopaedic cement into the vertebral body. The usage of balloon devices makes kyphoplasty stand apart from vertebroplasty. The gradual inflation of balloon and insertion of devices help restore the pre-fracture shape and height of the vertebral bodies. The kyphoplasty procedures lead to the long-term maintenance of spinal bones injured by compression fractures. This procedure reduces pain in individuals; lessens the need for pain medications; decreases dependence on canes or other supporting devices; and helps return to a relatively normal level of physical activity.

According to the report, osteoporosis is characterized by the loss of bone density and the thinning of bone tissues in the body. The disease accounts for about 85% of overall VCF cases. In the US, 50% of women and 25% of men suffer from osteoporosis-related fractures. About eight million women have osteoporosis, and about 22 million are at risk of developing the disease. Around 700,000 vertebral body fractures are diagnosed annually in the US, with 115,000 being admitted to hospitals for treatment. At least one

in two women and one in four men in the US suffer from osteoporosis-related fractures.
