Banknote substrates refer to the base materials used in the production of currency notes. Traditionally, most banknotes have been made from cotton-based paper, which provides durability and a unique texture. However, advancements in technology have introduced polymer substrates, which are synthetic materials like biaxially oriented polypropylene (BOPP) that offer superior resistance to wear, tear, and environmental factors. Banknote substrates serve as the foundation for the design, security features, and overall durability of the currency. They play a crucial role in the functionality and lifespan of banknotes, with different substrates chosen based on a country's economic needs, climate, and security requirements. In addition to paper and polymer, some countries also use hybrid substrates, combining both materials to balance durability and tradition.
