Abstracts

According to our (Global Info Research) latest study, the global Bare Chip market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Bare chip (die, bare die, chip, die form, wafer form) is the product form of semiconductor components before they are manufactured and packaged. Bare chips usually exist in the form of wafer form or die form, and become components of semiconductor components, integrated circuits, or more complex circuits (hybrid circuits) after packaging.

The industry will experience major ups and downs in 2022, according to World Semiconductor Trade Statistics (WSTS). While chip sales reached their highest-ever annual total in 2022, a slowdown in the second half of the year significantly limited growth. In 2022, global semiconductor sales will reach 574 billion U.S. dollars, of which U.S. semiconductor companies will have a total sales of 275 billion U.S. dollars, accounting for 48% of the global market. In order to maintain industry competitiveness, U.S. semiconductor companies' investment in research and development has also reached an all-time high of \$58.8 billion. Historically, the PC/computer and communications end markets accounted for approximately two-thirds of total sales, with industries such as automotive, industrial and consumer electronics accounting for the remainder. But according to WSTS' 2022 Semiconductor End-Use Survey, sales by end market in 2022 show a clear shift. While the PC/computer and communications end markets still account for the largest share of semiconductor sales in 2022, their lead has narrowed. Meanwhile, automotive and industrial applications experienced the largest growth this year.
