## Abstracts

Barium/zinc type heat stabilizer has excellent thermal and light stability, small initial coloration, good transparency and color stability. Their stabilizing effect is stronger than that of solid complex soaps, so the dosage can be reduced, generally 2-3 parts, no dust poisoning occurs, and they are completely dissolved in general plasticizers, with good dispersibility and small precipitation tendency. The importance of liquid barium-zinc stabilizer systems is growing day by day, and there are a wide variety of liquid ba/zn stabilizers available on the market, which can be used in almost all fields from semi-rigid to plasticized PVC, including calendaring, extrusion, injection extrusion Blow moulding, injection blow moulding and plastisol processing.

According to our (Global Info Research) latest study, the global Barium-Zinc Type Heat Stabilizer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Barium-zinc stabilizer is a stabilizer developed to replace Cd salts and is widely used as the main stabilizer in soft formulations. According to statistics, in the stabilizer market in the United States in 1987, barium and zinc stabilizers accounted for 21%, and showed an upward trend year by year. In addition to barium soap and zinc soap, its constituent components include phosphite and coloring inhibitor. New excellent performance phosphites continue to appear, prompting the rapid development of such stabilizers. In particular, in recent years, the use of  $\beta$ -diketone compounds as initial coloration inhibitors has made Ba-Zn stabilizers more perfect. Its main advantages are as follows.

1. Weather resistance is better than Ba-Cd stabilizer.

2. The cold resistance is improved, which can reduce the amount of phosphate ester auxiliary plasticizer

The barium-zinc stabilizer is mainly used for the calendaring of plasticized PVC and the processing of plastisol. The thermal stability of liquid Ba - Zn is comparable to that of liquid Ba - Cd in terms of compatibility with commonly used plasticizers and transparency of stabilized PVC. Ba-Zn stabilizers are slightly inferior in light stability, which can be compensated by mixing epoxy plasticizers and UV absorbers. Ba is also a heavy metal. Although the solubility in water is extremely small, if it enters the digestive tract, the acidity in the stomach can increase its solubility and cause greater toxicity.
