Abstracts

According to our (Global Info Research) latest study, the global Barrier Coatings market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The barrier coating ideally protects the base material by providing an impermeable barrier for moisture and corrosive substances.

A 'coating' is a thin covering applied to the surface of a substrate for functional purposes, such as gas barrier function, adhesion, wettability, or corrosion resistance. Lacquers are coatings that are largely used in the packaging industry to improve the barrier properties of the plastic film substrate. Commonly used coatings act as barriers to oxygen, moisture/water vapor or CO₂ in order to prevent the penetration or loss of the specific gas. Other barrier functionalities are against UV, to protect the packaged content from light, or against volatile organics, to preserve aroma.
