Abstracts

The global Basalt Fiber Woven Fabric market size is expected to reach \$ 137 million by 2032, rising at a market growth of 8.3% CAGR during the forecast period (2026-2032).

Basalt Fiber Woven Fabric is a high-performance technical textile made by interlacing continuous basalt fiber yarns or rovings in warp and weft directions through weaving structures such as plain, twill, satin or basket weave. The fiber is produced from natural basalt rock and is characterized by good tensile strength, heat resistance, fire resistance, corrosion resistance, dimensional stability and electrical insulation. Compared with glass fiber woven fabric, basalt woven fabric generally offers better thermal and chemical resistance; compared with carbon fiber woven fabric, it is lower in stiffness and strength but more cost-effective and less electrically conductive. It is mainly used as a dry reinforcement fabric, heat-resistant textile or functional substrate in composite and industrial applications.

In 2025, global sales of Basalt Fiber Woven Fabric reached approximately 9,528 tons, with an average global market price of around US\$ 8/kg. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 20% to 40%.

Basalt Fiber Woven Fabric is a relatively mature technical textile form within the downstream chain of continuous basalt fiber, combining the roles of composite reinforcement and functional industrial fabric. Compared with glass fiber fabric, basalt woven fabric offers advantages in heat resistance, corrosion resistance, acid and alkali resistance, dimensional stability and environmental profile. Compared with carbon fiber and aramid fabric, it does not provide the highest stiffness, strength or impact resistance, but it offers a more balanced cost-performance profile. This makes it

suitable for applications where performance, durability and cost must be considered at the same time, especially in construction reinforcement, corrosion-resistant equipment, industrial thermal insulation, electrical insulation and general composite materials.

The market outlook is mainly supported by infrastructure durability requirements, transportation lightweighting, industrial safety upgrades and the substitution of greener materials. In construction and municipal engineering, growing demand for corrosion-resistant, crack-resistant and lightweight reinforcement materials creates opportunities in concrete strengthening, wall reinforcement, fire barrier layers and repair systems. In industrial applications, demand is driven by thermal insulation, fire protection, sealing and electrical insulation under high-temperature operating conditions, supporting its use in welding protection, pipeline insulation, furnace thermal barriers and electrical insulation structures. As resin compatibility, surface treatment and fabric specification systems continue to improve, basalt woven fabric is expected to move from a low-cost substitute material toward higher-performance structural reinforcement applications.

However, the market still faces clear constraints. The stability of basalt raw fiber quality, yarn breakage during weaving, surface sizing and resin interface compatibility can affect downstream qualification results. At the same time, glass fiber still has strong advantages in cost, standardization and supply chain maturity, meaning basalt woven fabric must demonstrate longer service life and better total cost performance in large-scale engineering applications. Future competition will shift from simple low-price supply toward basalt rock consistency, filament uniformity, weaving quality, coating and finishing capability, application certification and co-development with downstream composite processing routes.
