Abstracts

According to our (Global Info Research) latest study, the global Battery Dry Electrode Binder market size was valued at US\$ 77.79 million in 2025 and is forecast to a readjusted size of US\$ 538 million by 2032 with a CAGR of 31.8% during review period.

Battery Dry Electrode Binder refers to polymer binder materials used in solvent-free or low-solvent dry electrode manufacturing processes for lithium-ion batteries, solid-state batteries, semi-solid batteries, sodium-ion batteries, and next-generation rechargeable batteries. These binders help active materials and conductive additives form a mechanically stable electrode film without conventional slurry coating and long drying processes. In this report, the market mainly includes PTFE dry electrode binders, PVDF dry-process binders, fluoropolymer binders, fibrillating binders, fluorine-free dry electrode binders, elastomeric binders, composite polymer binders, and customized binder systems for dry-coated cathodes and anodes. The 2025 benchmark ASP is US\$180,000 / ton, shipment volume is 0.42k tons, and average gross margin is 44%. The upstream industry chain includes fluoropolymer resins, PTFE powder, PVDF resin, acrylic polymers, polyethylene materials, elastomers, polymer additives, functional monomers, catalysts, solvents for polymer synthesis, and specialty chemical intermediates. The midstream includes binder polymerization, powder processing, particle size control, surface modification, compounding, fibrillation performance tuning, quality testing, packaging, and application validation with dry electrode coating processes. The downstream includes electric vehicle batteries, energy storage batteries, consumer electronics batteries, solid-state batteries, semi-solid batteries, sodium-ion batteries, battery cell manufacturing, and battery materials R&D.

Battery dry electrode binders are gaining importance as battery manufacturers seek

lower-energy, cleaner, and more scalable electrode production methods. Dry electrode processing can reduce or eliminate solvent use, simplify drying steps, improve manufacturing efficiency, and support thicker electrode designs. In this process, the binder must provide strong cohesion, good adhesion to current collectors, stable fibrillation or film-forming behavior, and compatibility with active materials, conductive additives, and calendaring conditions. Product development is moving toward lower binder loading, better mechanical strength, improved electrode flexibility, stronger interfacial adhesion, lower resistance, better compatibility with solid-state battery systems, and fluorine-free alternatives for sustainability and recycling needs.
