According to our (Global Info Research) latest study, the global Battery Grade Iron(II) Oxalate market size was valued at US\$ 333 million in 2024 and is forecast to a readjusted size of USD 447 million by 2031 with a CAGR of 3.9% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Battery Grade Iron(II) Oxalate is a high-purity inorganic compound that is a light yellow crystalline powder at room temperature. It is slightly soluble in water but easily soluble in acid solutions. Its purity is usually high, and the particle size is controlled within 3-5 microns to meet the synthesis requirements of lithium iron phosphate (LiFePO₄), the positive electrode material for lithium-ion batteries. As the core iron source of lithium iron phosphate, its purity and particle size directly affect the energy density and cycle life of the battery. As a key raw material for new energy materials, the market for battery-grade ferrous oxalate is deeply bound to the lithium battery industry. As the global penetration rate of electric vehicles increases, the demand for lithium iron phosphate will drive the growth of demand for battery-grade ferrous oxalate.
