Abstracts

The global Battery Pack Sealant market size is expected to reach \$ 2559 million by 2032, rising at a market growth of 8.8% CAGR during the forecast period (2026-2032).

Battery Pack Sealants are functional adhesive and sealing materials used in the enclosures, covers, trays, connectors, pressure relief valves, and structural joints of electric vehicle and energy storage battery packs. Major product technologies include polyurethane, silicone, silane-modified polymers (SMP), butyl rubber, and hot-melt pressure-sensitive adhesive systems. Applied through dispensing, coating, foaming, or preformed gasket processes, these materials create continuous sealing interfaces that prevent the ingress of moisture, dust, and salt spray while also providing flame resistance, electrical insulation, vibration damping, aging resistance, and reworkability. They are widely used in passenger vehicle battery packs, commercial vehicle battery systems, and stationary energy storage systems. The overall gross margin is approximately 42%.

Demand for battery pack sealants is driven by growing electric vehicle adoption, higher battery system voltages, and increasing battery pack integration. As battery pack designs evolve from traditional module-based architectures toward CTP (Cell-to-Pack), CTC (Cell-to-Chassis), and large-module configurations, the sealing areas around covers, trays, frames, and high-voltage interfaces continue to expand. Moisture protection, salt spray resistance, flame-retardant performance, long-term compression recovery, and automated dispensing consistency have become key procurement criteria. Reopenable and reworkable sealing systems are receiving increasing attention from OEMs and battery manufacturers because after-sales maintenance, second-life applications, and battery recycling require a balance between sealing reliability and serviceability.

The competitive landscape consists of both international adhesive suppliers and domestic battery adhesive manufacturers. Companies such as Henkel, 3M, Sika, H.B. Fuller, and Bostik established early positions in serviceable sealing solutions, CIPG (Cured-In-Place Gasket), FIPG (Formed-In-Place Gasket), and automated manufacturing processes. Domestic suppliers have gained traction by leveraging rapid response capabilities within the power battery supply chain and competitive solutions in polyurethane, silicone, and thermally conductive structural adhesive technologies.

Future growth will focus on low-density foamed sealing systems, flame-retardant low-smoke formulations, low-VOC chemistries, in-line seal path inspection technologies, and multi-substrate adhesion performance compatible with aluminum alloys, steel, composite materials, and coated surfaces.
