According to our (Global Info Research) latest study, the global Battery Recycling market size was valued at USD 8334.7 million in 2023 and is forecast to a readjusted size of USD 10630 million by 2030 with a CAGR of 3.5% during review period.

Battery recycling is a process that aims at diminishing the number of batteries being disposed of as municipal solid waste. Batteries consist of several heavy metals and toxic chemicals. Therefore, disposing of them as regular trash has raised concerns about water pollution and soil contamination. The soil and water pollution caused by the disposal of batteries as a municipal waste has resulted in the need to take necessary steps to recycle batteries. Various governments have mandated battery recycling processes.

The lead-acid battery chemistry segment dominated the global battery recycling market in 2017, followed by the lithium-based and nickel-based chemistries. Lead-acid is the most common type of chemistry, and is used in a wide range of automotive and industrial applications. The lead-acid chemistry segment is projected to witness the highest growth from 2018 to 2023, due to the increasing use of starting, lighting, and ignition (SLI) batteries.
