The global BC Battery (Back Contact Battery) market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

BC battery is a photovoltaic cell based on organic semiconductor materials. It has the characteristics of high conversion efficiency, low manufacturing cost, light weight, thinness, and bendability. It is regarded as one of the important development directions of the future photovoltaic industry. The main advantages of BC cells are that the single-sided efficiency is relatively high, and the front side is not blocked by grid lines, so it can obtain more light energy, has a relatively high aesthetics, and is suitable for distributed applications; the disadvantages are that the stability is relatively poor, and it is mainly single-sided. Batteries, so the application of ground power stations will be more cautious.

The BC battery is to set the PN junction and metal contact on the back of the solar cell, and the front of the cell uses SiNx/SiOx double-layer anti-reflection passivation film, without metal electrode shielding, to maximize the use of incident light, reduce optical loss, and bring more Large effective power generation area, high conversion efficiency, and more beautiful appearance.
