According to our (Global Info Research) latest study, the global Beam Focusing System market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

The beam focusing system is an important technical device, a system for controlling and adjusting the spatial distribution and transmission path of charged particle beams (such as ion beams, electron beams, etc.). The system uses electromagnetic fields (such as electric fields and magnetic fields) to keep the particle beam in a focused state during transmission so as to obtain a smaller beam spot size and higher energy density at the target position.

The working principle of the beam focusing system is based on the action of electromagnetic force. By adjusting the intensity and distribution of the electric or magnetic field, the charged particles can be subjected to different forces in the electromagnetic field, thereby changing their motion trajectory and achieving the focusing and control of the ion beam. The electric field focusing system focuses the ion beam mainly through the electric field between the electrode plates, while the magnetic field focusing system uses the Lorentz force of the magnetic field on the charged particles to achieve focusing.
