Abstracts

According to our (Global Info Research) latest study, the global Beam Shutter market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Beam shutters typically interrupt or release a beam by inserting or removing an absorbing or reflecting blade. This process may be controlled manually, but often there is an electromechanical actuator for remote-controlled and/or automatic operation. For example, beam shutters are often connected to laser safety interlocks so that laser hazards are avoided e.g. when a laser enclosure is opened. For fail-safe operation, a shutter device may be made such that it automatically closes when its control signal disappears – for example, simply with a spring or based on gravity. The risk of jamming should be minimized with an appropriate design.
