Abstracts

The global Beam Steering Mirrors market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A beam steering mirror is a commonly used optical element that can turn the direction of a beam of light 90 or 180 degrees, typically consisting of two or more reflective surfaces. Among them, the most common is a right angle reflector, which is composed of two vertical reflecting surfaces and can turn the beam direction 90 degrees. A right angle reflector is usually made of glass or optical glass, with a high-precision polishing treatment on the surface to ensure optical performance. Beam steering mirrors are widely used in optical systems, such as lasers, microscopes, telescopes, Optical instrument, etc., to change the light path or beam direction. In a laser, the beam steering mirror can reflect the laser beam from the laser tube, forming a laser output. In microscopes and telescopes, the beam steering mirror can turn the light of the observed object towards the eyepiece or camera for observation and recording. In Optical instrument, the beam steering mirror can turn or separate the optical path to meet specific measurement or analysis needs. In summary, beam steering mirrors are an important optical component with a wide range of applications and market demands.

This report studies the global Beam Steering Mirrors production, demand, key manufacturers, and key regions.
