Abstracts

According to our (Global Info Research) latest study, the global Beam Viewing Card market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

When working with laser beams in non-visible spectral regions (i.e., with infrared light or ultraviolet light), it is often essential to have some way of making beam positions and beam profiles visible. A low-cost way of doing this is using beam viewing card, also called infrared sensor cards or detector cards. Such a tool – often made of a plastic (e.g. polyester) with the size of a credit card or larger – has a photosensitive area which emits visible light (or in some cases changes its color) when it is hit by laser light in a certain wavelength region. It therefore becomes possible e.g. to follow the path of a laser beam and to check whether it hits optical components at the desired positions.
