Beamforming Integrated Circuit (IC) is an integrated circuit used for radio frequency (RF) communication. It is mainly used in wireless communication systems to convert signals in transmitters or receivers into beams, which allows for focusing and enhancing transmissions in specific directions while suppressing noise and interference. This integrated circuit typically consists of parts such as a digital signal processor, RF frontend, and antenna array, and can also include modules such as power amplifiers, low-noise amplifiers, and mixers. Compared to traditional antenna technology, Beamforming IC can provide better signal quality, higher data transfer rates, and stronger signal penetration, making it widely used in fields such as 5G mobile communication, radar, millimeter wave communication, aviation and aerospace, and military applications.
