A ball bearing is a type of rolling-element bearing that uses balls to maintain the separation between the bearing races. The purpose of a ball bearing is to reduce rotational friction and support radial and axial loads. It achieves this by using at least three races to contain the balls and transmit the loads through the balls. In most applications, one race is stationary and the other is attached to the rotating assembly (e.g., a hub or shaft). As one of the bearing races rotates it causes the balls to rotate as well. Because the balls are rolling they have a much lower coefficient of friction than if two flat surfaces were sliding against each other.

Scope of the Report:

This report focuses on the Bearing Ball in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. Wind power generation?increase in investment in railways and aerospace?environmental problems are key drivers for bearing ball. Several wind turbine components such as the gearbox, generator, and the pitch and yaw system include bearing balls. Since wind turbines help in minimizing carbon emissions, there is a constant rise in the number of wind turbine installations around the world. Activities to protect the environment are gaining momentum worldwide; following in the footsteps of other industries, the bearing industry is also making the shift toward developing new types of application-specific bearings for the wind energy segment. APAC was the least affected region during the 2009 recession and the industrial sector in the region managed to sustain its growth, thus driving the market for ball bearings. The worldwide market for Bearing Ball is expected to grow at a CAGR of roughly xx%

over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
