According to our (Global Info Research) latest study, the global Bee Pollen market size was valued at USD 631.9 million in 2023 and is forecast to a readjusted size of USD 876.5 million by 2030 with a CAGR of 4.8% during review period.

Bee pollen is the pollen ball that has been packed by worker honeybees into pellets. Bee bread is also the bee pollen with added honey and bee secretions and stored in brood cells. chambers of honeybees or of wood and mud created by female ground-nesting (such as the Leaf cutting Bee) bees. With the Leaf cutting Bee, when the pollen ball is complete, a single female lays an egg on top of the pollen ball, and seals the brood cell. Pollen balls are harvested as food for humans. Bee pollen is sometimes referred to as ambrosia. Whereas with Honeybees, the thing to keep in mind is that the forager bees that gather pollen do not eat it themselves, since when they transition to foraging, they stop producing the proteolytic enzymes necessary to digest it. So the foragers unload the pollen they've gathered directly into open cells located at the interface between the brood and stored honey, creating a typical band of what is called beebread - the substance which is the main food source for honey bee larvae and workers.
