Abstracts

According to our (Global Info Research) latest study, the global Beef Genomic Testing Service market size was valued at US\$ 7203 million in 2025 and is forecast to a readjusted size of US\$ 10038 million by 2032 with a CAGR of 4.9% during review period.

Beef genomic testing service is a professional service that use gene sequencing and microarray technology to scan and analyze the entire genome or key gene loci of individual beef cattle. Its core function is to transform invisible genetic potential into quantifiable breeding data, solving the fundamental problems of traditional beef cattle breeding, such as long phenotypic selection cycles, low efficiency, and the inability to accurately predict breeding performance, disease risk, and offspring genetic value in the early stages. This represents a leap from "experience-based breeding" to "precision breeding." Upstream are technology, equipment, and data providers, including gene sequencer and microarray manufacturers, bioinformatics software companies, and global beef cattle genotype and phenotypic databases. Downstream, it directly serves core participants in the beef cattle industry, primarily including: 1. Breeding farms (for selecting top-performing bulls and core cows); 2. Commercial fattening farms (for screening high-performance feeder cattle and optimizing fattening herds); 3. Slaughtering and processing enterprises and brand owners (for tracing the genetic origin of meat, ensuring consistent meat quality, and brand marketing). In 2025, the average price of beef genomic testing service was approximately US\$120 per head, with a gross profit margin of approximately 45%.
