The Beidou agricultural machinery automatic driving system is a type of precision agriculture technology that uses the Beidou Navigation Satellite System (BDS) to enable automatic driving of agricultural machinery in China. The system uses a combination of high-precision positioning technology, sensor technology, and advanced algorithms to guide agricultural machinery, such as tractors and harvesters, to navigate and perform various tasks in the field.

The Beidou navigation system is a global navigation satellite system (GNSS) developed by China, similar to the GPS system developed by the United States. The Beidou system provides accurate positioning and timing information to users in China and other parts of the world.

The Beidou agricultural machinery automatic driving system utilizes the high-precision positioning capabilities of the Beidou system to enable automatic driving of agricultural machinery with centimeter-level accuracy. This allows farmers to optimize the use of their equipment and improve the efficiency of their operations.

The system uses a combination of sensors, including cameras, radar, and lidar, to detect obstacles and navigate around them. It also uses advanced algorithms to adjust

the speed and direction of the machinery based on the characteristics of the crop and terrain, helping to optimize yield and reduce crop damage.

Overall, the Beidou agricultural machinery automatic driving system is a key technology in the development of precision agriculture in China, helping farmers to increase efficiency, reduce labor costs, and improve the sustainability of their operations.
