The global Belt Haul-off Machine market size is expected to reach \$ 6848 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

In 2025, global production of belt-type haul-off machines reached approximately 685,000 units. A Belt Haul-off Machine is a type of continuous pulling equipment widely used in plastic extrusion production lines. It operates by using one or multiple sets of synchronously running belts to apply uniform frictional force to extruded pipes, profiles, or hoses, steadily pulling them out from the extruder die at a controlled speed. It works in coordination with downstream processes such as cutting or winding to enable continuous production. This equipment is characterized by stable pulling force, minimal surface damage to the product, and strong adaptability. It is particularly suitable for the production of small-diameter pipes, flexible materials, and precision profiles. As such, it is a key auxiliary machine in automated plastic processing production lines.

As a key auxiliary equipment in plastic extrusion production lines, the Belt Haul-off Machine is widely used in continuous forming processes such as pipes, profiles, and hoses. With the global plastic processing industry moving toward higher levels of automation, precision, and efficiency, downstream manufacturers are placing increasingly stringent requirements on the stability, synchronization control capability, and surface protection performance of haul-off equipment. This trend has driven the continued application and technological upgrading of such equipment, particularly in medium- and low-speed extrusion production lines. At the same time, demand growth in industries such as construction materials, automotive components, wire and cable, and packaging materials has accelerated the upgrading and transformation of production lines, further expanding the application scope of belt haul-off machines. Industry competition is primarily focused on the optimization of control systems, improvements in

mechanical structure design, and the integration capability with intelligent production line systems.
