A benchtop chromatography system is a laboratory device used to separate and purify compounds. It is usually composed of a variety of functional modules, including pumps, columns, detectors, dispensers, and control systems. It distributes samples in a chromatographic column filled with specific adsorbent materials through the flow of liquid or gas, thereby achieving separation based on the differences in the interactions between different components and the adsorbent. Benchtop chromatography systems are widely used in chemistry, biochemistry, pharmaceutical research, and environmental analysis. They are used to analyze the components of complex samples, separate and purify target molecules, and detect and analyze reaction products.
