## Abstracts

The global Bend Insensitive Fiber Optic Cable market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Bending insensitive optical fiber cable is a new type of optical fiber communication transmission medium, which adopts a special optical fiber structure design, which can withstand a smaller bending radius without affecting the quality of optical signal transmission, thereby enhancing the durability and reliability. The main advantage of the bend-insensitive fiber optic cable is that there will be no loss or interference of the optical signal when the cable is bent or twisted, ensuring stable transmission of the optical signal. The inner core of this fiber optic cable is usually made of high-purity glass or quartz material, and the outer layer is usually protected with special coatings and protective layers. Bend-insensitive fiber optic cables can be widely used in occasions that require frequent bending and twisting, such as data centers, indoor wiring, medical devices, automotive electronics, home networks, etc.
