Abstracts

The global Benzyl Trichloride market size is expected to reach \$ 129 million by 2032, rising at a market growth of 6.8% CAGR during the forecast period (2026-2032).

Benzyl trichloride is an organic intermediate, appearing as a colorless to pale yellow transparent liquid with a characteristic pungent odor. It is mainly used in the industrial synthesis of benzoyl chloride and benzoic acid, and is used in dyes, pesticides, and UV absorbers. It is highly corrosive, toxic, and flammable, requiring low-temperature, sealed storage. Global sales in 2025 were approximately 70,000 tons, with an average selling price of \$1150 per ton. The industry's gross profit margin is around 20%.

The upstream core raw materials are toluene (derived from petroleum refining or coking) and liquid chlorine (derived from the chlor-alkali industry). Production costs are significantly affected by fluctuations in crude oil prices and the chlor-alkali balance. The midstream involves the production and refining processes of benzyl trichloride. The mainstream process is the toluene photocatalytic chlorination method. Downstream applications are high-value-added and widespread. The primary destination of benzyl trichloride is to produce benzoyl chloride through hydrolysis or trifluorotoluene through fluorination. These intermediates further penetrate downstream into end markets such as high-efficiency pesticides, pharmaceuticals (e.g., broad-spectrum antibiotics), and UV absorbers.

The booming global life sciences and new materials industries are the strongest growth engine for the benzyl trichloride industry. Firstly, the explosive growth of fluorinated pesticides and pharmaceuticals has significantly boosted demand for benzyl trichloride. Due to the unique electronic effects of fluorine atoms, the application of fluorinated compounds in herbicides and antiviral drugs continues to rise, and benzyl trichloride is

an indispensable starting material for synthesizing these products. Secondly, the increasing demand for ultraviolet absorbers in polymer materials has driven the steady expansion of the downstream benzoyl chloride market. Furthermore, green upgrading policies in chemical industrial parks have prompted the industry to concentrate on leading companies with strong resource integration capabilities and complete chlorine balance and hydrochloric acid byproduct recovery capabilities. This structural optimization has significantly improved the overall stability and profitability of the supply chain.

Despite its broad application prospects, the industry still faces severe constraints. The production of benzyl trichloride involves the use of liquid chlorine and the production of large amounts of hydrogen chloride as a byproduct, requiring extremely high corrosion resistance from equipment, posing significant environmental and intrinsic safety barriers for enterprises.

This report studies the global Benzyl Trichloride production, demand, key manufacturers, and key regions.
