Abstracts

The global Betaine Monohydrate market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Betaine Monohydrate is a crystalline form of betaine, a compound containing crystal water molecules. Betaine is a compound that occurs naturally in plant and animal cells, also known as betaine salt or betaine.

Betaine plays an important physiological role in organisms, helping to regulate water balance in cells, promoting protein folding and stability, and participating in some metabolic processes. Therefore, betaine is widely used in fields such as agriculture, food, feed and medicine.

The crystalline form of betaine monohydrate means that its crystal structure contains one molecule of water of crystallization. Water of crystallization is a water molecule physically adsorbed in a crystal, and different crystalline forms may contain different amounts of water of crystallization. For betaine, betaine monohydrate means that each crystallization of betaine molecules contains one molecule of water.
