Abstracts

The global Bevel Gears for Automotive Differentials market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Bevel Gears for Automotive Differentials are an important component of the differential, also known as the differential bevel gear set. It usually consists of the ring teeth, two side gears and the differential shaft. The role of the differential bevel gear is to enable the left and right drive wheels to rotate at different speeds when the vehicle is turning, thereby avoiding slipping between the drive wheels. When driving in a straight line, the differential bevel gears spin at the same speed, distributing power equally to the two drive wheels. But when turning, because the inner and outer wheels need to rotate at different speeds, the differential bevel gear set will make the drive wheels with different speeds obtain appropriate power output, thereby maintaining the stability and handling of the vehicle.
