Abstracts

BOPE is an acronym of the term Bi-axially Oriented Polyethylene, a chemical designation for a category of flexible plastic films created under specific conditions. This specification of Polyethylene (PE) film is manufactured using a 'blown' process, meaning that the plastic sheeting is pulled in two directions, otherwise known as 'bi-axially' stretched. This biorientation is typically achieved by inflating a 'bubble' shaped column of film inside an extruder using air pressure, which serves to pull the film both in transverse (TD) and machine direction (MD) at the same time, before the material is cooled and laid flat. Alternatively, biorientation can be achieved using a specialist tenter frame to apply the two-directional stretch force uniformly, but this method is mostly used for stabilised films such as BOPP (Biaxially-Oriented Polypropylene).
