## Abstracts

According to our (Global Info Research) latest study, the global Bicycle Brake Linings market size was valued at US\$ 988 million in 2025 and is forecast to a readjusted size of US\$ 1372 million by 2032 with a CAGR of 4.9% during review period.

Bicycle brake pads are key friction components installed in bicycle braking systems. They are typically fixed to the brake caliper or brake arm and generate friction through contact with the rim or disc brake, thus achieving deceleration and stopping. Their materials are mostly made of resin, semi-metallic, or sintered metal formulations, requiring a balance between braking force, wear resistance, heat dissipation, and noise control. As a consumable part that directly determines braking efficiency and riding safety, bicycle brake pads are widely used in various types of bicycles, including road bikes, mountain bikes, and e-bikes, and are an indispensable core consumable in bicycle braking systems. In 2025, sales reached 400 million units, with an average price of \$2.40 per pad, total production capacity of 450 million units, and a gross margin of 18%.

From the perspective of riding safety and upgraded usage scenarios, bicycle brake pads are transforming from a 'basic consumable' to a 'performance and safety component.' With the increasing prevalence of high-load, high-speed scenarios such as mountain biking, long-distance riding, and e-bikes, users are paying significantly more attention to braking stability, wet performance, and high-temperature brake fade control. Compared to the earlier focus solely on 'being able to stop,' the market now emphasizes controllability and consistency under high speeds, continuous braking, and complex road conditions. This is driving the continued growth in demand for high-performance resin formulations, semi-metallic, and sintered metal brake pads, and also increasing

the market share of mid-to-high-end products.

From an industry structure and product evolution perspective, the brake pad market is showing a clear trend towards segmentation and brand concentration. On the one hand, different vehicle types and applications (road/mountain/gravel/e-bike) have significantly different requirements for friction coefficient, heat resistance, and lifespan, prompting manufacturers to develop specialized products for specific braking systems (such as Shimano, SRAM, and Magura). On the other hand, with the rapid adoption of disc brakes in mid-to-high-end bicycles, disc brake pads have become the fastest-growing sub-category. In the future, manufacturers with stable formula control capabilities, batch consistency, and brand trust are more likely to gain a sustained advantage in the after-sales and OEM markets, while the price competition space for low-end general-purpose products will be further compressed.
