Abstracts

The global Bicycle Linings market size is expected to reach \$ 1372 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032). Bicycle brake pads are the core friction components of a bicycle braking system. Installed on the brake assembly, they generate friction through contact with the rim or disc brake, enabling the vehicle to slow down and stop. They are typically made of resin, semi-metallic, or sintered metal materials, and require a balance between braking force, wear resistance, heat resistance, and noise control. As a typical consumable part, bicycle brake pads directly affect riding safety and braking feel, and are widely used in various types of bicycles, including road bikes, mountain bikes, and e-bikes. They are an indispensable key safety component in the braking system. Sales volume in 2025 is projected at 400 million units, with an average price of \$2.40 per unit, total production capacity at 450 million units, and a gross margin of 18%.

From the perspective of cycling safety and upgraded usage scenarios, bicycle brake pads are transforming from 'basic consumables' to 'performance and safety components.' With the increasing prevalence of high-load, high-speed scenarios such as mountain biking, long-distance riding, and e-bikes, users are paying significantly more attention to braking stability, wet performance, and high-temperature brake fade control. Compared to the earlier focus on simply 'being able to stop,' the market now emphasizes controllability and consistency under high speeds, continuous braking, and complex road conditions. This is driving the continued growth in demand for high-performance resin formulations, semi-metallic, and sintered metal brake pads, and also increasing the proportion of mid-to-high-end products in the overall market.

From the perspective of industry structure and product evolution, the brake pad market is showing a clear trend of segmentation and brand concentration. On the one hand, different vehicle models and applications such as road/mountain/gravel/electric-assist have significantly different requirements for friction coefficient, heat resistance, and

lifespan, prompting manufacturers to develop specialized products for specific braking systems (such as Shimano, SRAM, and Magura). On the other hand, with the rapid adoption of disc brakes in mid-to-high-end bicycles, disc brake pads have become the fastest-growing sub-category. In the future, manufacturers with stable formula control capabilities, batch consistency, and brand trust are more likely to gain a sustained advantage in the aftermarket and OEM supply chain, while the price competition space for low-end general-purpose products will be further compressed. This report studies the global Bicycle Linings production, demand, key manufacturers, and key regions.
