According to our (Global Info Research) latest study, the global Bicyclic Peptide market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Bicyclic Peptide is a type of short peptide composed of 9-15 amino acids produced by chemical synthesis method, with a molecular weight between 1.5-2 kDa. Bicyclic peptides are a class of polypeptides with two macrocyclic rings, which have advantages over linear and monocyclic peptides. They own a flexible route of administration similar to small-molecule drugs and rapid tissue penetration. Moreover, bicyclic peptides can be eliminated by kidney metabolism and have less potential toxicity to the liver and intestines. So they have certain advantageous properties of monoclonal antibodies and small molecules, and may be suitable candidates for treatment with low toxicity drugs.
