Abstracts

The global Bidirectional Barbed Suture market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A barbed suture is a type of knotless surgical suture that has barbs on its surface. While suturing tissue, these barbs penetrate inside the tissue and lock them into place, eliminating the need for knots to tie the suture. Conventional sutures rely on a surgeon's ability to tie secure knots; barbed sutures provide a knotless alternative in some surgical situations. Barbed sutures are primarily used in cosmetic surgery. Bi-directional is a double-armed suture. Barbs reverse direction at the mid-point of the suture.

This report studies the global Bidirectional Barbed Suture production, demand, key manufacturers, and key regions.
