Abstracts

According to our (Global Info Research) latest study, the global Bidirectional Logic Bus Transceiver market size was valued at US\$ 4719 million in 2025 and is forecast to a readjusted size of US\$ 7952 million by 2032 with a CAGR of 7.7% during review period.

Bidirectional logic bus transceivers, as the physical layer interface chip between MCUs/SoCs and fieldbuses/vehicle buses, are fundamental components for reliable differential communication and bus protection in systems such as automotive electronics, motor drives, industrial control, and building/energy management. Their core value lies in solving the pain points of traditional single-ended communication in long-distance, multi-node, and electromagnetically interference-prone environments, such as easy bit errors, easy lock-up, difficulty in suppressing common-mode interference, and the ability of node power failure/short circuit to bring down the entire network. In typical automotive CAN/LIN networks, industrial RS-485 buses, and building and energy management fieldbuses, without highly robust bus transceivers, the controller side cannot withstand common-mode interference of -7 to +12 V or even higher, cable misconnections, and transient surges, making it difficult to guarantee system reliability and security. In 2025, global sales of bidirectional logic bus transceivers across various application scenarios were estimated at 5.88 billion units. The average selling price was approximately USD 0.75-0.85 per unit, and the overall gross profit margin was approximately 28%-40%, with automotive and industrial bus transceivers such as CAN/LIN/RS-485 being the main contributors. A typical bidirectional bus transceiver structure includes: TXD/RXD or differential I/O pins connected to the controller side, a bus-side differential driver/receiver stage (such as CANH/CANL, A/B lines), current limiting and overvoltage protection networks, ESD/surge protection circuitry, fault protection and bus fail-safe circuitry, low-

power/standby/wake-up logic, power supply and reference circuitry, and package pin/heat dissipation structure. Common parameters include: support for bus standards (CAN FD/LIN/RS-485/RS-422, etc.), data rates from 20 kbit/s (LIN) to 1 Mbit/s, 2.5 Mbit/s (CAN FD) and even 50 Mbit/s, supply voltage of 3.3 V or 5 V, common-mode voltage range of -7 to +12 V or even -12 to +12 V, bus-side ESD protection of 8-16 kV, and operating temperature of -40 to +125 °C. In terms of typical system usage: a gasoline-powered vehicle requires a total of 15-30 CAN/LIN bus transceivers, while a mid-to-high-end new energy vehicle can have 30-60; a medium-sized PLC/distributed I/O station requires approximately 2-6 RS-485/fieldbus transceivers; a photovoltaic inverter/energy storage BMS system requires 4-10 transceivers; and industrial motors/servo drives typically require 1-3 transceivers. The upstream mainly relies on mature process logic and high-voltage wafers (8/16/32 nm and above), packaging substrates and molding materials, precision resistors, capacitors and protection devices, and lead frames; the downstream focuses on automotive ECU manufacturers, industrial control and PLC manufacturers, motor and drive manufacturers, photovoltaic and energy storage system integrators, and building/energy management and rail transit control system suppliers.
