Abstracts

According to our (Global Info Research) latest study, the global Bigelizumab market size was valued at US\$ 268 million in 2025 and is forecast to a readjusted size of US\$ 975 million by 2032 with a CAGR of 12.4% during review period.

Bigelizumab is a humanized anti-interleukin-17A monoclonal antibody designed for the treatment of autoimmune and inflammatory diseases. It selectively binds to IL-17A with high affinity, blocks its interaction with cellular receptors, and inhibits downstream pro-inflammatory signaling pathways, thereby reducing inflammation, tissue damage, and disease activity. With favorable safety and pharmacokinetic properties, it is being investigated in clinical trials mainly for moderate to severe psoriasis, psoriatic arthritis, and other IL-17-mediated disorders, aiming to provide a safe and effective biological option for patients with inadequate response to conventional therapies. In 2025, global Bigelizumab production reached approximately 1.2-1.5 million units.

Bigelizumab, a fully human monoclonal antibody targeting IL-17A, operates within a rapidly expanding market for autoimmune disease biologics, driven by rising global clinical demand for psoriasis, psoriatic arthritis, and other related indications. While the IL-17 inhibitor segment is highly competitive with established therapies, Bigelizumab holds differentiation potential through its high binding affinity, favorable pharmacokinetics, and strong safety profile. Its future commercial success will depend on clinical efficacy, approved indications, reimbursement access, pricing strategy, and commercial execution, amid intensifying competition from existing IL-17 inhibitors, dual-targeted agents, and rapidly emerging domestic biologic alternatives.
