The bimorph deformable mirror is a wavefront correction device mainly used in various adaptive optical systems. It corrects the phase of the light wave front by changing the phase structure of the light wave front, thereby achieving the purpose of correcting aberrations. The bimorphic deformable mirror is made of piezoelectric ceramic sheets with patterned electrodes and glass sheets bonded together, and the surface is coated with a reflective film. Compared with other types of deformable mirrors, the advantages of bipiezoelectric deformable mirrors are simple structure, large deformation, and can be used to achieve medium diameters.
