According to our (Global Info Research) latest study, the global Bin Picking Software market size was valued at US\$ 1343 million in 2025 and is forecast to a readjusted size of US\$ 2014 million by 2032 with a CAGR of 6.0% during review period.

Bin picking software is a type of industrial automation software that uses 3D sensor and object recognition algorithms to enable robotic arms to identify, pick, and place objects from a bin or container. Bin picking software is a software system used in industrial automation that enables robots to automatically identify and grasp objects from bins. This software typically combines technologies such as artificial intelligence, machine vision, motion planning, and control algorithms. It uses a 3D camera to capture three-dimensional images of objects in the bin. It then uses artificial intelligence and deep learning algorithms to identify and analyze the objects' shape, position, and posture. Then, based on motion planning algorithms, it calculates the robot's optimal grasping path and posture, ensuring the robot can accurately, efficiently, and collision-freely grasp objects from the bin and place them in the designated location.

With continuous technological innovation, the mainstream methods for finding grasping points fall into three categories: model-based, semi-model-based, and model-free. Model-based methods are more reliable in relatively controlled environments, semi-model-based methods have benefited from advances in computer vision image segmentation, and model-free methods offer the advantages of low training costs and generalizability to objects of similar shapes. Furthermore, advances in hardware technologies such as depth cameras will also drive the development of bin picking software.

Bin picking software was initially used primarily in the automotive and electronics

manufacturing industries for grasping and sorting parts. However, as the technology matures and costs decrease, its application has gradually expanded to industries such as logistics, packaging, and food and beverage. For example, in the logistics industry, it can be used for sorting and handling goods; in the food and beverage industry, it can be used for grasping and packaging food.
