According to our (Global Info Research) latest study, the global Binocular Face Recognition Module market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Binocular face recognition module uses dual-camera technology to capture and recognize three-dimensional information of the face by simulating the human eye visual system. The module uses two cameras to capture facial images from different angles, and obtains the depth information of the face by calculating the parallax between the two images, thereby constructing a more accurate three-dimensional face model. This technology not only improves the accuracy and robustness of face recognition, but also effectively resists two-dimensional attacks such as photos and videos. The binocular face recognition module is widely used in access control systems, security monitoring, smart payment and other fields, providing users with safer and more convenient identity authentication services.
