According to our (Global Info Research) latest study, the global Bio-Based Dimethyl Ether market size was valued at USD 435.2 million in 2022 and is forecast to a readjusted size of USD 603.7 million by 2029 with a CAGR of 4.8% during review period.

The production of bio-DME (dimethylether) is very similar to that of biomethanol. Bio-DME can be produced directly from synthesis gas, which is still under development. However, in the chemical industry, DME is produced from pure methanol by means of a process called catalytic dehydration, which chemically separates the water from the methanol. This methanol can be produced from coal, natural gas, or biomass. Often the production of methanol and DME is combined in one process. Research on the application of DME as an automotive fuel has only started recently. In the past, DME derived from fossil fuels, was mainly used as a substitute propellant for chlorofluorocarbons (CFCs) in spray cans. Bio-DME is a suitable diesel engine fuel due to its low-self-ignition temperature and high cetane number. However, DME cannot be blended with fossil diesel and its volumetric energy content is much lower, approximately half that of diesel. Retrofitting diesel engines for the use of DME is relatively simple.
