## **Abstracts**

Chemical based herbicides are known to create water and soil pollution. These chemicals affect human health through food consumption. Bio-herbicide is compound derived from microbes including fungi, bacteria, and protozoa.

### **Scope of the Report:**

This report focuses on the Bio herbicides in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. Organic farming has gained popularity among consumers demanding for organically produced vegetables and food grains. Increasing awareness programs to educate consumers regarding noxious chemical impacts is anticipated to trigger the global product usage. Manufacturers in collaboration with local governing bodies have been focusing on educating farmers for increasing the bio-herbicides consumption. The shift in consumer preference towards healthier and nutritional food products is also expected to positively impact overall product demand. Low prices of synthetic herbicides are expected to remain a key challenge for its penetration in the global market. Additionally, chemical based herbicides are known to show better results on account of which farmers tend to use them more than bio-herbicides. Lack of awareness among the farmers is also anticipated to restrain the industry development in the near future. Integration of bio-herbicides with chemical herbicides increases the impact of bio based products on weed and helps in enhancing the process efficiency. The worldwide market for Bio herbicides is expected to grow at a CAGR of roughly 10.9% over the next five years, will reach 2770 million US\$ in 2023, from 1490 million US\$ in 2017, according to a new GIR (Global Info Research) study.
