## Abstracts

The process of applying natural or controlled antimicrobials to preserve food materials for extending its shelf life is known as biopreservation. The biopreservation process is usually carried out with the help of lactic acid bacteria (LAB) as they are inhibitory to microbes responsible for food spoilage. The key agents applied in biopreservation process are lactic acid bacteria, yeast, and bacteriophages. The process is carried out to preserve materials such as meat, seafood, and other food materials.
