According to our (Global Info Research) latest study, the global Bio-Sensors for Non-clinical Applications market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Biosensors were first introduced in 1962 with the development of enzyme electrodes by scientist Leland C. Clark. Since then, research communities from fields such as very large scale integration, chemistry, physics, and material science have come together to develop more reliable, sophisticated, and mature biosensors. These biosensors found their applications in the field of medicine, biotechnology, agriculture, as well as military and bioterrorism detection and prevention.

Nanotechnology is an emerging technology that involves the study, creation, manipulation, and use of materials, devices, and systems with dimensions lesser than 100 nm. It also plays a crucial role in the development of biosensors. Nanomaterials not only help introduce several new signal transduction technologies in biosensors but also improve the sensitivity and performance of biosensors. The development of nanotech has resulted in an increase in the applications of nanomaterials in biosensors to a large extent. For example, nanomaterials-based biosensors can significantly increase the sensitivity and specificity of biomolecule detection, detect and manipulate atoms and molecules, and also show potential in applications such as biomolecular recognition, pathogenic diagnosis, and environment monitoring. Moreover, various kinds of nanomaterials, including carbon nanotubes, gold nanoparticles, and quantum dots are being increasingly used in biosensors due to their unique chemical, physical, mechanical, magnetic, and optical properties. The is anticipated to result in the manufacturing of better and more efficient biosensors, leading to their augmented

adoption in the coming years.
