The biochip spotter is a device used for positioning and quantitatively spotting on the surface of biochips. The working principle of the biochip spotter is mainly based on precise mechanical movement and droplet control technology. It uses a micro-liquid distribution system to accurately drop the biomolecule solution in the form of extremely small droplets to the designated position on the chip surface. During the whole process, the spotter strictly controls the size, shape and position of the droplets to ensure the consistency and repeatability of the spotting.

The driving factors of the market can be summarized as follows:
