Biocides for oil and gas are chemical substances used to control microbial growth and prevent the formation of biofilms in oil and gas production systems. Microbes, including bacteria, fungi, and algae, can cause various problems in oil and gas production, including corrosion, fouling, and reduced production rates. Biocides are used to prevent these issues and maintain the integrity and efficiency of oil and gas production systems. Biocides can be classified into two main categories: oxidizing and non-oxidizing. Oxidizing biocides, such as chlorine and bromine compounds, are used for short-term control of microbial growth in oil and gas production systems. Non-oxidizing biocides, such as quaternary ammonium compounds, glutaraldehyde, and isothiazolinone, are used for long-term control of microbial growth in oil and gas production systems.
