Abstracts

Biocomposite is a composite material formed by a matrix (resin) and a reinforcement of natural fibers. These kind of materials often mimic the structure of the living materials involved in the process keeping the strengthening properties of the matrix that was used, but always providing biocompatibility. The matrix phase is formed by polymers derived from renewable and nonrenewable resources. The matrix is important to protect the fibers from environmental degradation and mechanical damage, to hold the fibers together and to transfer the loads on it.

Scope of the Report:

This report focuses on the Biocomposites in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. By end-use industry, the transportation segment is projected to be the fastest-growing end-use industry segment of the market during the forecast period. Biocomposites are used in the automotive industry owing to their lightweight, impact resistance, and non-toxic features. Also, no sharp-edged fractures are formed in case of a crash, thereby providing safety to passengers. The increasing demand for naturally sourced, non-toxic, and impact resistant materials in the transportation end-use industry is anticipated to drive the biocomposites market between 2018 and 2023. The worldwide market for Biocomposites is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
