Abstracts

The global Biogas Sensors market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Biogas sensors are specialized sensors designed to detect and measure the composition and concentration of gases produced during the anaerobic digestion of organic matter, a process that generates biogas. Biogas is a renewable energy source primarily composed of methane (CH₄) and carbon dioxide (CO₂), along with trace amounts of other gases such as hydrogen sulfide (H₂S), ammonia (NH₃), and water vapor (H₂O). These sensors play a critical role in various applications related to biogas production, monitoring, and safety.

Biogas sensors employ various technologies, including infrared (IR) sensors, electrochemical sensors, catalytic sensors, and thermal conductivity sensors, to detect and measure the concentration of specific gases. Biogas sensors are used in anaerobic digestion systems, such as biogas plants or digesters, to continuously monitor the composition and quality of biogas. This information is crucial for optimizing the production process, ensuring maximum methane content, and identifying potential issues such as gas impurities or system malfunctions.
